Pop Up Drain

Cleaning and Maintenance Guide:

The drainage of the washbasin needs a flexible drainer, such as a pop-up type, to ensure that the wastewater flows out of the basin quickly and smoothly. High-quality drainers can be tightly leak-proof and effectively filter hair.

Pop-up Waste Cleaning Guides:

Take out the pop-up waste and soak all accessories in the mixed vinegar, and wait for more than 15 minutes. Prepare an old toothbrush to scrub all the parts. You will find that the dirt is easily brushed off at this time. Finally, take care to rinse in another sink with plenty of water and put it back in the original basin. For stubborn stains, you can try diluted bleach or alcohol.

Pop-up Waste Maintenance Guides:

1. Regular preventive maintenance is the most convenient way to maintain excellent drainage.
2. Avoid using strong acid or alkali solution to clean the pop-up waste parts in that it will deform the metal and damage the metal surface.
3. When removing the pop-up waste, pay attention to distinguish the removed parts that need to be cleaned and impurities that need to be discarded.
4. When rinsing parts, be sure to go to another sink.
