# Siphon

## Cleaning and Maintenance Guide:

There is a siphon directly connected to the pop-up drainer. The material of the new-style siphon is mainly brass that has a superior ability to withstand cold and hot pressure. Its high-quality abrasion resistance prolongs its service life. As an indispensable part of the drainage system, the siphon discharges after receiving the wastewater.

### Siphon Cleaning Guides:

First, put on rubber gloves to unscrew the siphon under the sink, and then disassemble all the parts and soak them in a mild detergent. After waiting for 20-30 minutes, take out an old toothbrush to scrub the dirt inside the siphon. Prepare a soft cotton cloth to clean the exterior. Finally, rinse and dry all parts in another sink.

### Siphon Maintenance Guides:

1. Cleaning once a month helps to maintain the excellent drainage performance of the siphon.
2. Be careful not to use strong chemical solutions to clean metal parts due to their strong corrosiveness that will damage the internal structure of the siphon.
3. Rough cloth is not suitable for removing impurities on the metal surface because it is prone to produce permanent scratches.
4. When rinsing parts, be sure to go to another sink.
5. After each maintenance, when the siphon is tightly fixed, turn on the faucet to check whether the installation is perfect without a water leak.
